

Additional Electrical Knockouts added to PS Product Line

August, 2000

Three electrical knockouts have been added to all Series PS housings. The additional knockouts are located on the opposite side of the control housing relative to the existing ones.

The additional knockouts stem from requests made by multiple customers who want more convenient electrical installation. The additional knockouts allow electrical connection to be made from either side of the control.

The dimensions of the PS housing have not been changed. The drawing below illustrates the location of the additional electrical knockouts. The circled area specifically points out the modification.

Series PS units with additional knockouts are currently being shipped. Please call me if you have any questions.
